

Fork Positioner for Forklifts

Fork Positioner for Forklift - The fork positioner is a hydraulic device that can allow the driver to work the lift truck without leaving the seat. They are constructed out of high quality materials and are intended to be able to endure the most demanding operations and work surroundings. Side shifting units have the added ability to be able to laterally position the entire load or the arms so as to facilitate much more exact lifting and position in a faster and more efficient way.

The fork pocket is quite unique and enables the individual operating it to securely sway the forks into position without any fear of destroying the positioning cylinders. This can allow the operator the alternative to execute independent or simultaneous fork movement, dependent upon the requirements of the job. For most forklifts with non-OEM carriages, complete carriages are necessary. Standard OEM carriages could be converted into blade positioners on available units.
